

External-load 1D consolidation: pressure-state migration

$k = 1\text{e-}4 \text{ m/s}$ | $\text{dt} = 10 \text{ us}$ | 1,000 soil particles | 0-0.2 s short regression

q0 exceeds the predefined pressure screening gates; overall Stage 1 acceptance is still open.

Baseline state = float high + float residual, reconstructed in double; aligned by particle ID and actual output time.

Source: tests/logs/pore_double_stage1/regression_history.csv. Short migration check, not full 2Tv accuracy or performance.
