

CPU Vel0 consolidation: the 0--30 ms event window

Same physics and integrator | output-only sampling diagnostic | 61 measured common-time frames; no interpolation

Vertical guide: prescribed 0.01 s event. Actual boundary activation is step-quantized; step difference is not true error.

Right panels use log scales; exact-zero differences are omitted, including coincident migration settlement trajectories.

Source: tests/logs/pore_double_vel0/event_history.csv and event_differences.csv. This supplements the original four runs.
