

CPU Vel0 consolidation: pressure and settlement histories

k = 1e-4 m/s | 1,000 soil particles | fixed initial top layer: 10 IDs | 201 frames per run

High/low / 10 us Double state / 10 us High/low / 5 us Double state / 5 us

Vertical guide: prescribed 0.01 s load end / drainage start; actual activation occurs at a time-step boundary.

Saved Part0 float position is a shared origin; subsequent positions and reconstructed pressure are read natively.

Source: tests/logs/pore_double_vel0/history.csv. Overlapping curves do not establish full 2Tv accuracy.
