

Tool self-check: the same completed baseline compared twice

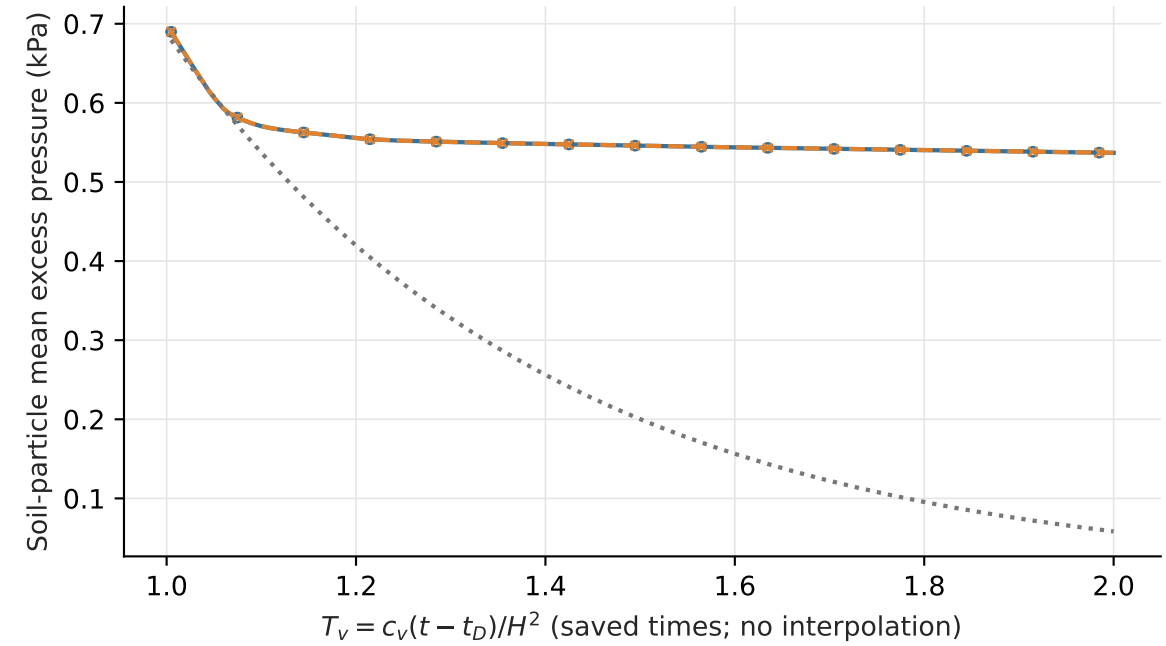

$k = 10^{-4}$ m/s | 1000 fixed soil IDs | 402 native BI4 frames | fixed initial top: 10 IDs

—●— Same baseline A (high + residual) —×— Same baseline B (high + residual) Classical Terzaghi reference

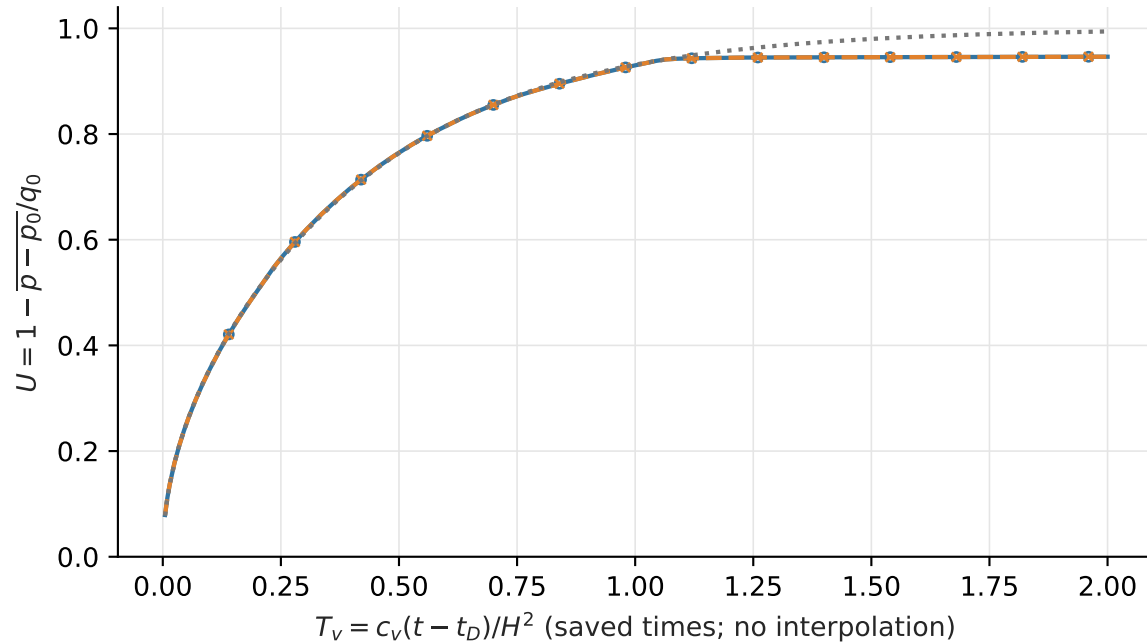

Mean excess pore pressure

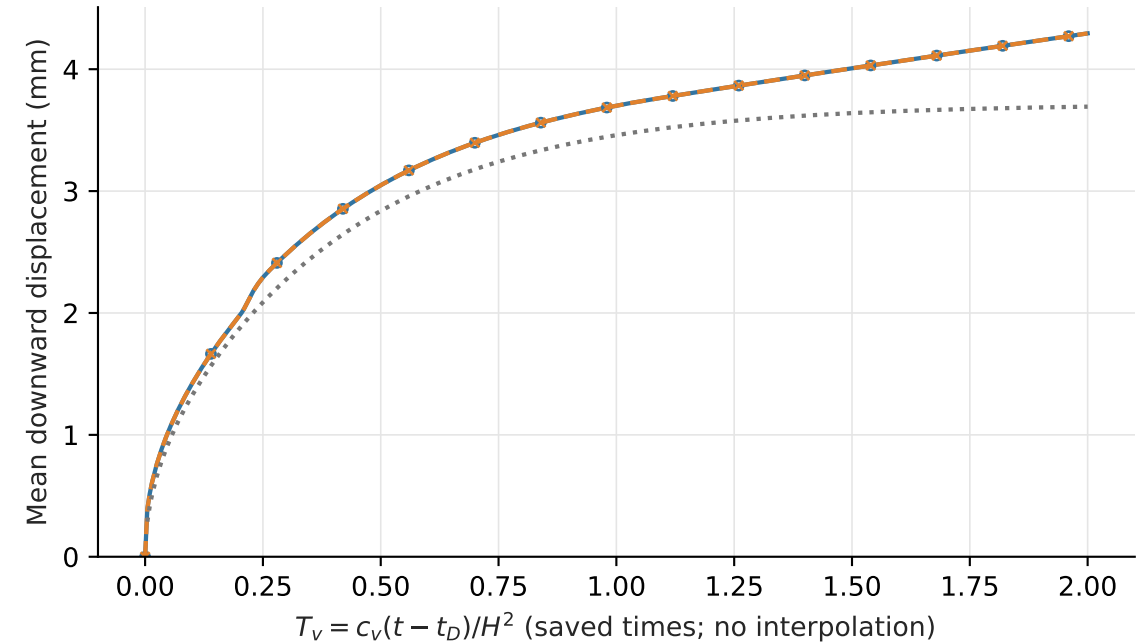

Late mean excess pressure ($T_v \geq 1$; focused view)

Pressure-based consolidation degree

Settlement of fixed initial top IDs

SELF-CHECK ONLY: overlapping curves are expected; this is not evidence of a migration improvement.

Gray: ideal small-strain Terzaghi physical reference, not an exact solution of the finite-Kw moving-particle SPH case.

Pressure: the same high + residual baseline twice. Settlement uses the common saved initial origin; layer IDs never change.
