

Tool self-check: fixed initial-layer pore-pressure profiles

100 initial layers, 10 identical particle IDs per layer | actual saved times; no interpolation

—●— Same baseline A (high + residual) —+— Same baseline B (high + residual) Classical Terzaghi reference

SELF-CHECK ONLY: both numerical series are the same baseline.

Each panel uses its own pressure-axis scale. Gray is a classical physical reference at the actual saved T_v and initial z_0 .

Profiles are Lagrangian initial-layer averages, not current- z bins; current layer heights are retained in the accompanying CSV.
